#### **DETALED ACTION**

### Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35
 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claim1 is rejected under 35 U.S.C. 102(e) as being anticipated by H'mimy (US 5,912,876).

Regarding claim 1, H'mimy describes an OFDM receiver system. H'mimy describes a method of receiving an OFDM signal and the process of extracting the information and known signals from the OFDM signal (col 4, ln 58 – col 5, ln 45).

H'mimy teaches that a **mixer** element combines the information signals (main signal) and the known signal (pilot signal) to generate a composite signal (col 3 ln 10-16). Thus, it is inherent that the known signals are dispersed in the information signals in the received OFDM composite signal.

H'mimy teaches an inverse fast Fourier transform (IFFT) (col 3 ln 16-18). It is common knowledge that the IFFT can position the known and information signals to the frequency bands as described in claim 1.

Regarding transmission path response is equivalent to frequency response.

H'mimy teaches a method and apparatus for calculating the frequency response using extracted known signals (pilot signals) (col 5 ln 13-15).

Regarding transmission path characteristics is equivalent to channel estimation.

H'mimy teaches a technique for **channel estimation**, using the extracted main signal and pilot signal (col 4 ln 58 - col 5 ln 45). This is accomplished using all the recovered information signals (col 5, ln 9-12) and the recovered pilot signal (col 5 ln 13-14).

H'mimy further teaches about using **channel estimation** and **equalization** for compensating amplitude and phase errors (col 1 ln 57-58) and (col 1 ln 66-67).

## Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 2664

4. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over H'mimy, in view of Siala (US 6,768,713).

Regarding claims 2, H'mimy discloses all aspects of the claimed invention set forth in the rejection of claim 1.

Re-iterating, transmission path characteristics is equivalent to channel estimation.

H'mimy does not explicitly disclose estimating channel path characteristics by linear interpolation.

However, Siala teaches channel estimation using interpolation (col 2 ln 14-17). In view of this, having the system of H'mimy and then given the teaching of Siala, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the system of H'mimy to incorporate the teachings of Siala.

The motivation to combine is because interpolation allows one to carry out an estimation of the channel at the positions of the pilot symbols and then extend this estimation to the data signals (col 2 line 30-33).

5. Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over H'mimy, and in view of Wahlqvist (US 6,088,398).

Regarding claims 4, H'mimy discloses all aspects of the claimed invention set forth in the rejection of claim 1.

H'mimy does not explicitly disclose estimation of the transmission path characteristics by interpolation using Sinc functions.

However, Wahlqvist teaches about a receiver comprising a channel estimation mechanism (col 7 ln 60). He further teaches about implementing the fast fourier transform (FFT) algorithm using Sinc function (Sin (x)/x) (col 3 ln 3-

6). The FFT is an essential component of measuring the frequency response. It is common knowledge that interpolation allows one to extend results from a small set of data points (pilot data symbols), to the responses that could be obtained for a larger set of data points.

In view of this, having the system of H'mimy and then given the teaching of Wahlqvist, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the system of H'mimy to incorporate the teachings of Wahlqvist.

The motivation to combine is because sinc functions can be easily manipulated to taper off interference signals in the adjacent side bands. Using interpolation on a small set of points necessitates less pilot symbols to be transmitted, thus saving bandwidth and power in the transmission.

### Claim Allowable

Art Unit: 2664

6. Claims 3 and 5 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

### Conclusions

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Sharif M Shahrier whose telephone number is (703) 305-870. The examiner can normally be reached on 8:30-5:00 M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ricky Ngo can be reached on (703) 305-4798. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
